REIN DROP

Brand Identity System v2.1

WHAT CHANGED
v2.1 retains the light-mode palette and adds a future character/sprite system as a brand-expression direction. The character is not the logo and its final design is intentionally unresolved.

1. Core brand

Rein Drop is bright, fast, commercial and alive. White creates clarity; Rein Navy provides authority; Rein Orange identifies the brand/action; Drop Yellow means fresh opportunity; Profit Green means money/success.

Token	Hex	Meaning
Canvas White	#FFFFFF	Dominant environment
Rein Navy	#12233F	Structure, headings, navigation
Rein Orange	#FF6B35	Signature/action
Drop Yellow	#FFC928	Freshness/opportunity
Profit Green	#16A66A	Profit/success
Sky Wash	#EAF4FF	Calm secondary surface
Loss Red	#D64545	Realized loss/destructive/error

2. Character system — future direction

Explore a distinctive Rein Drop character that can repeatedly interact with a shipping/inventory box. The goal is not a generic 'AI mascot'; it is a recognizable piece of brand behavior that makes functional product moments memorable.

Important
The character is a brand asset, NOT the logo. Do not lock its species/form/personality yet. The current idea is directional: an energetic orange character + a box + repeatable poses + sprite-based animation.

Why the box works

- It connects naturally to inventory, buying, selling, delivery and the physical goods resellers handle.
- It creates a prop the character can interact with across many states rather than simply standing beside text.
- A box can represent 'something just dropped', inventory found, a Hunt working, a purchase, a sale or an empty state.
- The prop creates repeatable silhouettes useful for sprites and small mobile illustrations.

Potential poses / moments

Pose	Possible product use
Pops out of a box	Welcome / onboarding / first successful setup
Carries a box	Monitoring / sourcing in progress
Walks with a box	Loading / background work / transition animation
Leans on a box	Empty state / waiting for opportunities
Looks inside a box	Analyzing a listing / searching
Points toward a box	CTA / create first Hunt
Celebrates beside box	Purchase or profitable sale logged
Sits with laptop on box	Analytics / learning / setup
Multiple boxes	Inventory / team / scaling
Box appears empty	No deals yet — handled positively, not as failure

Sprite strategy

- Design the master character in poses that can simplify cleanly at mobile scale.
- Prefer short loops and state animations over long cinematic sequences.
- Build reusable sprite states: idle, walk/carry, pop, inspect, point, celebrate, wait.
- Animations should have static fallbacks for accessibility, reduced-motion settings and low-power contexts.
- Keep animation assets independent of business logic; product state chooses an animation token.
- Do not make users wait for a character animation before they can act.

Character usage rules

- Use the character at emotional/product moments, not on every card.
- Never let it compete with price, margin, freshness or the primary action.
- Avoid turning serious errors, losses or payment failures into jokes.
- Keep the character's orange visually distinct from CTA orange if necessary through shading/outline while staying in the brand family.
- The character may appear more frequently during onboarding/empty/success states and much less in dense analytics.
- Do not imitate an existing commercial mascot; final artwork must become recognizably Rein Drop.

3. UI brand behavior

Meaning	Treatment
Action / Rein Drop	Orange
Fresh opportunity	Yellow + explicit timestamp/text
Profit / success	Green
Structure / intelligence	Navy
Loss / destructive	Red
Character moment	Illustrative accent; never replaces semantic status

4. Typography

Inter remains the recommended UI typeface: 400–500 body, 600 controls, 700–800 headlines/KPIs. The character supplies personality; typography should remain highly legible.

5. Logo remains deferred

Use a simple Rein Drop wordmark during MVP. The character concept must not pressure the team into turning the mascot or box into the logo. Logo exploration can happen after the real product screens establish what visual ideas are genuinely distinctive.

6. Immediate implementation

- Continue using the v2 palette/design tokens.
- Reserve optional illustration zones in onboarding, empty and success states without requiring final mascot art.
- Use temporary non-mascot placeholders during MVP UI implementation.
- When the product's key screens are stable, commission/design the character as a sprite-ready system rather than a single hero illustration.
- Test character visibility at small phone sizes before expanding the animation library.
